REMONDIS®

WORKING FOR THE FUTURE

Custom Partnership Models for your Company

Our partnership models are intended for companies that want to have part or all of their water management provided by an external partner. We offer our customers customised solutions and comprehensive service concepts for operation – from planning and construction to financing, if necessary. With our broad expertise, we help you to concentrate fully on your core business while we design the desired project scope according to your specific requirements.

Customer benefits

- 1

Elimination of planning risks

 - _ Customer-specific concepts through extensive operating experience across various industries
 - _ Selection of a process technology suitable for the defined requirements
 - _ Long-term implementation of process concept from a single source
- 2

Elimination of operating risks

 - _ Responsibility for entire water management system
 - _ Supporting stable plant operation with contractually defined treatment targets
 - _ Effective solutions in the case of changing operating conditions through decades of experience
- 3

Elimination of cost risks

 - _ Responsibility for economic risk in the selection of process technology and suppliers
 - _ Enforcement of warranty and defect claims towards suppliers
 - _ Predictable operating costs over the term of the contract

Management model

Reliable cost structures thanks to efficient management. We support you with our expertise and skilled team through this partnership model, providing the necessary operating materials, looking after system maintenance and taking care of waste disposal. The term of the management contract can be agreed individually. In order to optimally present the economic and technical potential of complex systems, terms of 10–15 years have proven effective. With this business management model, your company benefits from defined quality standards and opportunities to optimize business processes and costs.

Digital water management thanks to IoT

The Internet of Things (IoT) is increasingly finding its way into water management. For example, flood, building, plant or chemical management can be monitored and optimised in real time with IoT. The technology used shows possibilities for process improvement and offers security through end-to-end encryption.

Operator model

This extensive partnership model, in which we can also take charge of financing, if required, in addition to planning, construction and operation of systems, provides considerable assistance to many companies in relation to additional, new and complex activities. We implement operator models in the area of waste water treatment in particular. These are suitable both for water supply and for the combination of both issues. Depending on the specific circumstances, this partnership model can optimize operational processes and unlock economic potential.
